

TECH NOTE

From Zero Surge Inc.

June 2015

Using Zero Surge Protection With an Uninterruptible Power Supply (UPS)

When using Zero Surge products with a UPS, the Zero Surge unit must be ahead of the UPS to protect the UPS and its connected equipment. This will also insure that the MOVs inside the UPS remain dormant, preventing ground line contamination.

Zero Surge's 15A, 20A, and 30A models are recommended for UPS applications. Any equipment that generates a surge (i.e., a laser printer) should be plugged directly into the Zero Surge unit and not into the UPS. This will allow the Zero Surge unit to filter the kickback surge.
